Perspectives in Electronic Publishing:
Experiments with a New Electronic Journal Model

by

Stephen Meirion Hitchcock

A thesis submitted for the degree of
Doctor of Philosophy

in the
Faculty Of Engineering And Applied Science
Department of Electronics And Computer Science

January 2002
The Internet and subsequently the World Wide Web made it possible for individual authors and new, independently-produced electronic publications to reach vastly greater numbers of readers than had previously been possible. The proliferation of electronic versions of commercial print journals that followed, however, has so far done little to alter the formal structures, character and culture of scholarly journals from the user’s perspective. The Web also represents the first large-scale use of a hypertext system, but hypertext developers have been disdainful of it as a limited implementation of other models. In turn, a criticism of some hypertext systems is that they have been too focused on system performance rather than the needs of users. This thesis examines the contention that augmenting the Web with a hypertext linking service will support the development of a new type of interconnected journal that allows users to explore individual lines of enquiry more efficiently. In this case the ‘journal’ frames a user-centric information environment, where selected documents can be distributed and accessed anywhere on the Web. Editorially-added links act as the binding between the resources selected for inclusion, and the selection and commentary on documents exercise the journal’s editorial ‘voice’.

A ‘journal’ based on this model was built and subjected to extensive evaluation by a targetted specialist group. In a series of tests these users were invited to offer their views on this and more general journal models; because this was not a hypothetical model their responses could be cross-checked against the results of their experiences of using the new journal model. Thus, users could not hide their true preferences. Although small in number, the target evaluation group provided strong reactions both for and against the model, revealing some of the challenges that radical new electronic journal models face if the structure of the traditional printed journal is to be displaced in favour of journals that can properly exploit the prospect of fully interconnected and accessible networked distribution.
# Table of Contents

Prologue: What time is it Eccles? ................................................................................................................. 1

1 Introduction ................................................................................................................................................... 4
   1.1 Motivations ........................................................................................................................................... 4
   1.2 Publishing background ....................................................................................................................... 6
   1.3 Plan of the thesis ................................................................................................................................. 8
   1.4 A note on terminology ....................................................................................................................... 11

2 Literature survey: the convergence of publishing and technology.......................................................... 13
   2.1 Electronic journals: why now? ........................................................................................................ 13
   2.2 The hypertext influence .................................................................................................................. 14
   2.3 A short history of electronic journals ............................................................................................ 15
   2.4 From hypertext to open systems .................................................................................................... 17
   2.5 Early Internet ‘journals’ .................................................................................................................. 20
   2.6 Eprints: complement or competitor to the journal monopoly? ................................................... 21
   2.7 The Web challenges the printed page ............................................................................................. 25
   2.8 Open information systems .............................................................................................................. 29
   2.9 Hypertext and the Web: the new missing link .............................................................................. 31
   2.10 Applying open access principles to journal content ..................................................................... 33
   2.11 Subverting the journals ................................................................................................................ 39

3 Innovations in electronic journals ......................................................................................................... 42
   3.1 Online journals 1990-95 .................................................................................................................. 43
   3.2 E-journals: progress in the digitisation era ...................................................................................... 45
   3.3 Progress in e-journal features: three snapshots spanning a decade .............................................. 47
   3.4 ‘Free’ e-journals ............................................................................................................................ 52
   3.5 Overlays, open access and omnipotence ......................................................................................... 53

4 The emerging scholarly communication infrastructure ............................................................................. 56
   4.1 Progress in libraries: preservation strategies .................................................................................. 57
      4.1.1 Progress in libraries: dealing with publishers ........................................................................... 59
      4.1.2 Progress in libraries: promoting competition .......................................................................... 61
      4.1.3 Progress in libraries: making appropriate connections ......................................................... 62
      4.1.4 Progress in libraries: summary ................................................................................................. 64
4.2 The foundations of open access ................................................................. 65
  4.2.1 Open access: layers of services ......................................................... 68
  4.2.2 Legitimising open access: the Open Archives initiative .................... 69
4.3 Digital library architecture: the Web services analogue ............................... 72
4.4 Access and interfaces: implications for journals ......................................... 73
4.5 Emerging infrastructure: summary ......................................................... 77

5 Reshaping scholarly publishing ...................................................................... 79
  5.1 Understanding ‘online’: the impact on journals ....................................... 79
  5.2 Reshaping the ‘journal’ .......................................................................... 81
    5.2.1 Constraints on the new model journal ....................................... 82
    5.2.2 Links: the bounding quality filters .......................................... 82
    5.2.3 Forces for change ................................................................. 83
  5.3 Decoupling journal content from publishing process .................................. 85
    5.3.1 The pivotal point: assignment of rights ................................... 86
    5.3.2 Eprint archives: the need to assert divisible rights ...................... 87
    5.3.3 The publishers’ dilemma ...................................................... 88
    5.3.4 Theory and practice of decoupling ......................................... 89
    5.3.5 Resistance to decoupling ...................................................... 91
  5.4 Defragmentation: tackling access inefficiencies ....................................... 92
    5.4.1 Defragmentation: search and link ........................................ 94
  5.5 Reshaping scholarly publishing: summary ............................................ 96

6 A new scholarly publishing model: the hypothesis ......................................... 98
  6.1 Anticipating a radical three-track electronic publishing framework .......... 98
    6.1.1 Update on the three-track publishing framework ....................... 99
  6.2 Anticipating the ‘unbound’ journal: the model ....................................... 101
    6.2.1 Updating the model ............................................................ 103
  6.3 A new journal model: summary ........................................................... 104

7 A new scholarly publishing model: implementation ..................................... 105
  7.1 Perspectives in Electronic Publishing .................................................... 107
  7.2 Design of PeP .................................................................................... 111
    7.2.1 The PeP record ...................................................................... 111
    7.2.2 Principal design features ...................................................... 113
      7.2.2.1 Electronic-only ............................................................. 113
      7.2.2.2 Added links ................................................................. 113
9.9.10 Funding PeP-like services .............................................................. 180
9.9.11 Using PeP: readers ................................................................. 181
9.9.12 Using PeP: authors ................................................................. 182
9.9.13 Evaluators’ conclusions .............................................................. 184
9.10 Target users: comparing their views with other evaluators ................. 186
9.11 Rebuilding PeP: recommendations ................................................... 186
9.12 Acknowledgement of evaluators ....................................................... 187

10 Conclusion ................................................................................................. 188

Acknowledgements

**Wendy Hall**, my PhD supervisor, for giving me the chance to start, for ensuring that I finished, and most of all for finding solutions when there seemed to be only problems.

**Les Carr**, for his advice throughout, and for directing the implementation of the link service used in the project, but in particular for those conversations at the outset that established the ideas for the work.

**Tim Miles-Board**, for his brilliant implementation of the link service. If users appear to criticise this aspect of the model, this is entirely due to my specification and not Tim’s link service, which fulfilled the brief when the prevailing technology seemed destined to deny it.

**Gareth Hughes**, for showing me how to use the intimidating Lotus Notes application to build the project database, and for managing the Web server that is the principal interface for users.

**Jessie Hey and Stephen Chan**, contemporary PhD students who completed their theses around the same time, for listening and sharing their experiences, and for their mutual encouragement.

**Gerry McKiernan**, whose correspondences as a target evaluator gave me particular encouragement, and who wrote an extensive review (McKiernan 2001) that could stand as chapter 7 of this thesis, but gave me the chance to write an alternative view of the design.

**Jim Till** for helpful correspondence and pointers.

**The project evaluators**, especially the expert and target evaluators who completed all stages of the evaluation, for an extraordinary effort that can be truly appreciated from the length of the Appendices (see section 9.12).

**All those who I have worked with on the Open Journal and Open Citation projects**, for ideas that have informed the thesis.

**Paul and Sue Lewis**, for offering me a retreat from my London home in Southampton as I completed the work, and to **Stan and Jean Roberts** for welcoming me to Southampton when I began.

**My family**, for allowing me to disappear for long periods, even during holidays; to **Jean**, for her stoicism, to **Katharine**, 13, and **Tom**, 9, both much younger when I set out on this project, who never missed a chance to wonder if it was all worth it.
